CC A method has been developed for the identification of a nucleic acid CC capable of modulating a process in a biological system. The method CC comprises: (a) introducing into the system a random library of nucleic CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC CC in systems where modulation has occurred and/or determining the sequence CC of at least part of the SBDs in such systems. Nucleic acid molecules with CC endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to CC cleave target nucleic acid, particularly for treating systemic diseases CC claused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic CC with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sequence and activity. AAV90922 to AAV93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-MAY-1997;

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous cleukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are identified by the ribozyme of the invention. The ribozymes is formed in a hammerhead motif, but may also be formed in the motif of a haripin, hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes may be used to inhibit the development or expression of a transformed phenotype in man and other animals by modulating expression of the corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic and transformed cells elicits inhibition of the transformed state.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         resistance; chemotherapeutic agent; colchicine; doxorubicin; colon; actinomycin D; vinblastine; small intestine; kidney; adrenal gland; adenocarcinoma; bowel; transformed phenotype; promyelocytic leukemia; human; chronic myelogenous leukemia; CML; follicular lymphoma; B-cell acute lymphocytic leukemia; breast cancer; colon carcinoma; neuroblastoma; lung cancer; genetic drift; mutation; hammerhead motif;
                                                                                                                                                                                                                                                              Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the mechanism of drug resistance used by transformed cells and thus enhances drug therapies for tumours. The ribozymes may also be used to study genetic drift and mutations within cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Breast cancer specific mRNA ribozyme cleavable nucleotide (1538).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a PCR primer for human apolipoprotein(a). The present invention also describes: (1) a vector containing human apolipoprotein(a) gene 5'-regulatory region DNA; (2) an isolated nucleotide sequence comprising at least 30 consecutive nucleotides of human apolipoprotein(a) gene 5'-regulatory region DNA or its complement; (3) a nucleotide sequence of at least 15 nucleotides capable of forming a DNA triplex with human apolipoprotein(a) gene 5'-regulatory region DNA; and (4) a transfected mammalian cell containing human apolipoprotein(a) gene 5'-regulatory region DNA where the heterologous sequence codes for an enzyme. The new promoter sequence is useful in genetic engineering and gene therapy. The promoter can specifically be used for regulating the expression of apolipoprotein(a), which is useful in the treatment of

                           The 431/26 VH and VK antibody fragments represented in AAQ26757-58 are pref. for the prodn. of the fusion proteins of formula huTuMAK-L-beta-Gluc (1) (huTuMAK-humanised, tumour-specific monoclonal antibody, or its tumour-binding fragments); L= linker; beta-Gluc= human beta-glucuronidase). BetaGlc Linker 1 and betaGlc Linker 2 oligonucleotides are given in AAQ26759-60. Hinge 1 and hinge 2b oligonucleotides are given in AAQ26759-60. Hinge 1 and hinge 2b oligonucleotides are given in AAQ26761-62. (1) are used to activate prodrugs. The antibody component provides for specific targetting to tumours while the beta-Gluc component activates a suitable prodrug and (1) is useful in tumour treatment or diagnosis. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              identified as molecule that modulates biological activity of native quadruplex DNA. (ML) is useful for identifying molecule that modulates biological activity of native quadruplex DNA (claimed). (ML) is useful for identifying molecule that modulates biological activity of native quadruplex DNA, where the identified molecule stabilizes quadruplex grundruplex DNA, where the identified molecule stabilizes quadruplex structure which can exert a therapeutic effect for certain cell proliferative discorders e.g., colorectal cancer, leukemia's, Hodgkin's disease, etc. This sequence corresponds to a test quadruplex molecule used in the method of the invention.
                                                                                                                                                                                                                                        Example
                                                                                                                                                                                                                                                                                                                                                    Seemann

                                                                                                                                                   The sequence is that of a probe based on a unique nucleic acid sequent in the Chlamydia trachomatis major outer membrane protein (MOMP) gewhich is present in all 15 serotypes of C. trachomatis. It correspond nucleotides 747-763 of the MOMP gene. It may be used for detecting amplitying the MOMP gene of C. trachomatis, and can detect all 15 serotypes of C. trachomatis. Since the MOMP gene is unique for C. trachomatis, there will be no cross-hybridisation to nucleic acid to the bacteria. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is that of an AU-rich element (ARE) motif. A 2-dimensional FIDA anisotropy analysis was performed to determine the affinity of human Hu-antigen R (HuR) for this, and other, ARES. The Kd caffinity of human Hu-antigen R (HuR) for this, and other, ARES. The Kd calle of a non-soluble form of full-length HuR ADES5987 for the ARE was 23.47 +/-8.92 nM. The ARE did not bind a soluble form of full-length HuR. The complex formation of an ARE-containing mENA with an HuR protein induces the expression of various disease causing/mediating site for HuR. The complex formation of an ARE-containing mENA with an HuR protein induces, such as inflammatory acting substances, e.g. cytokines, growth factors, proto-oncogenes and viral proteins. Agents which inhibit complex formation may thus prevent the expression of such substances and may be used in the treatment of e.g. inflammatory diseases. The invention provides an assay for identifying compounds with an inhibitory effect on selected HuR-ARE target interactions. A pharmaceutical composition comprising an agent identified by the assay can be used to treat a disorder having an aetiology associated with the production of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of the human NAC-1 protein. The DNA and protein sequences of the invention are useful for treating or preventing a disorder associated with decreased or increased expression or activity of human NAC-1. The DNA and protein sequences are also useful for treating drug addiction and cancer. The present DNA sequence represents an RT-PCR primer for the human NAC-1
                                                                                     Identifying molecule that modulates biological activity of native quadruplex DNA, by contacting test quadruplex DNA with candidate molecule, determining presence or absence of interaction between molecule and test quadruplex DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                   the
```

The invention relates to a method of identifying (M1) a molecule that modulates biological activity of native quadruplex DNA, by contacting test quadruplex DNA with candidate molecule, and determining presence absence of interaction between candidate molecule and test quadruplex DNA, where candidate molecule that interacts with test quadruplex DNA.

microsateIlite sequences given in GenBank AF077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are usef for mapping of the genome of various species of shrimp. Mapping the genome of Penaeus is useful for determining whether a test shrimp, preferably litopenaeus vannemei, has a genotype associated with a phenotypic trait such as resistance to Taura Syndrome Virus (TSV) infection. The present sequence is that of a probe, useful in examples the invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptor protein is designated SHTR2B. SHTR2B is a G protein coupled receptor (GPCR) which comprises 7 transmembrane regions. The specification describes a method for using a specific inhibitor of the SHT2B receptor to prepare a composition for treating a solid epithelial tumour in which the SHT2B gene is overexpressed. Inhibition of the SHT2 receptor blocks cell proliferation and invasion. Inhibitors of the invention are used to treat or prevent uncological tumours (particularly of prostate, bladder and kidney), but also cancers of the breast, lung and colon. The detection of overexpression of SHTR2B, or the related mRNA, is used for in vitro detection of tumorous cells.
                                                                                                                                                                                                              The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vanmened (ABN00997-ABN81172), both containing microsatellites sequences including those P. monodon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10-DEC-1999;

Chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-6 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC engiratory or lung disease is associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC eroeptor(s), and/or asthma and/or lung allergies associated with cC inflammation or an inflammatory disease. The respiratory or lung disease cost in the respiratory or lung disease cost in the cost of a composition of the cost of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; asthma; lung antien; allergy; impleded respiration; cystic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.
allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction of bronchoconstriction. This sequence represents an oligonucleotide of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2004-293804/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Botaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; CF chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension;
                                                                                                                                                                                                                                   Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                              Nyce JW, Sa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammation, disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

Also described are: inhibiting the expression of IAP-like in a sample using for a modulator of IAP-like; a CC diagnostic method for identifying a disease state comprising identifying the presence of IAP-like in a sample using at least one of the primers celected from 2 sequences comprising SEQ ID NO. 5 or 6, or the probe comprising SEQ ID NO. 7; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like. It is also useful for diagnosing or treating diseases associated with CC expression of IAP-like, e.g. a hyperproliferative disorder. This sequence represents a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 2146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a compound 8-80 nucleobases in length targeted to CC a nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like, where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the CC expression of IAP-like. Also described are: inhibiting the expression of IAP-like in a sample using for a modulator of IAP-like, a CC diagnostic method for identifying a disease state comprising identifying the presence of IAP-like in a sample using at least one of the primers CC the presence of IAP-like in a sample using at least one of the primers CC selected from 2 sequences comprising SEQ ID NO. 5 or 6, or the probe CC comprising SEQ ID NO. 7, a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like. CC like. The compound is useful for modulating the expression of IAP-like, e.g. a hyperproliferative disorder. This sequence conficiency and the supplements a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Specifically, it refers to a method to test for the immunity balance or ratio between Th1 and Th2 helper T cells. The present invention describes the target helper T cell proteins that are activated or suppressed by Th1/Th2, and include the Th1 targets C/EBP (alpha), GATA-4, Notch-4, IRS-4, placental Ca2+ binding protein, CD6, Galactin-3, CD97, DEC1, Onzin, GBB3, CD49b, CD29 and BMP-10, whereas the functional molecules of the Th2 lymphocyte include integrin(betal7, PCSK3, GP49b, CTLA-2(alpha), TDAG51, CD53, laminin(alpha)5, PPAR(gamma), ECM1, CRABP2, CYP1A(P450scc), 20(alpha) - hydroxysteroid dehydrogenase (20-alpha-HSD) and CCR2.
20(alpha) - the method further involves using the gene of the functional molecule of helper T cell, a gene product, an antibody of the gene product and at least one of the cells transduced with the gene as an antibody of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 transplant rejection; immune system; rheumatoid arthritis; lupus; inflammatory bowel disease; multiple sclerosis; HIV; AIDS; ss; probe

melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid san from a subject. Preventing melanoma in a subject comprises detecting presence or absence of one or more polymorphic variations associated melanoma in a nucleic acid sample from a subject; and administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, in ar xenotransplant rejection or mechanical organ replacement rejection, in ar individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lung, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonucleotide marker for diagnosis and monitoring of a the content of the c

The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cardiac ankyrin repeat kinase/fucose-1-phosphate guanylyltransferase, CARK/FPGT, proximal probe.

Also included are inhibiting the expression of squalene synthase in cells or tissues, screening for a modulator of squalene synthase, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with squalene synthase. The compound and methods are useful in diagnosing and treating disorders related to cholesterol biosynthesis e.g. atherosclerosis, coronary heart disease and hypercholesterolaemia. The present sequence is an antisense oligonucleotide of the invention.
                                                                                                                                The present invention is directed to antisense oligonucleotides which are targeted to mucosa-associated lymphatic tissue (MALT) I and which modulate the expression of MALTI. The invention is useful for preparing a composition for treating hyperproliferative disorder such as cancer. The invention acts as a cytostatic agent. The invention is also useful in gene therapy. The present sequence is human MALTI target oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                            New oligonucleotide compound that inhibits expression of MALT1, useful for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mucosa-associated lymphatic tissue 1; MALT1; hyperproliferative cancer; cytostatic; gene therapy; human; ss.

The invention is useful for preparing a composition for treating hyperproliferative disorder such as cancer. The invention acts as a cytostatic agent. The invention is also useful in gene therapy. The present sequence is human MALT1 antisense oligonucleotide. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New oligonucleotide compound that inhibits expression of MALT1, useful for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid molec encoding SLC26A2. The antisense oligonucleotide is useful for inhibit the expression of SLC26A2 in cells or tissues to prevent or treat diseases associated with aberrant SLC26A2 expression, such as chondrodysplasia. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a human SLC26A2 target sequence.

The antisense oligonuclectide is useful for inhibiting the expression of SLC26A2 in cells or tissues to prevent or treat diseases associated with aberrant SLC26A2 expression, such as chondrodysplasia. In addition, the compound is used for diagnostics,
                                                                                                                                                                                                                                      Homo sapiens
Synthetic.
                                                                                                                                                                                                                                                                                  Antisense; Talin; cardiac disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antisense oligonucleotides for modulating SI for diagnosing, preventing or treating diseases SLC26A2 expression, such as chondrodysplasia.

                                           New antisense oligonucleotides which inhibit the expression of dual specific phosphatase 6, useful for e.g. treating disease or condition associated with the expression of dual specific phosphatase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; ss; dual specific phosphatase 6; DUST6; MAP kinase; extracellular signal related kinase; ERK; hyperproliferative disorder developmental disorder; neural disorder; apoptotic disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention is useful for treating a disease or condition associated with Talin such as a disease or condition e.g. muscular, haematologic, cardiac or hyperproliferative discorder such as cancer. The present sequence is an antisense oilgonucleotide targeted to human Talin DNA.
                                                                                                                                                                                                                                                                                                                                                            18-JUL-2002; 2002US-00199221
                                                                                                                                                                                                                                                                                                                                                                                                               09-FEB-2004; 2004US-00774888

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NO: 4. The oligomeric compound hybridises to nucleobases 53-195 in the UTR of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435. The antisense compound is useful for inhibiting the expression of dual

                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC oligonuclectide) 8-50 nucleobases in length comprising a sequence CC complementary to a nucleic acid molecule encoding dual specific CC phosphatase 6 (DUST6, phosphorylating Map kinase and extracellular signal CC related kinase, ERK) appearing as ADP96435. Also included are a CC composition comprising the oligonucleotide (and a pharmaceutical carrier CC or diluent) and a method of inhibiting the expression of dual specific CC phosphatase 6 in cells or tissues comprising contacting the cells or CC tissues with the antisense oligonucleotide. The oligomeric compound CC inhibits the expression of dual specific phosphatase 6 by at least 60%, CC and hybridises to nucleobases 369-389, 480-500, 657-677, 713-818, 923-CC 1028, 1196-1216, 12771893, or 1757-1860 in the coding region of SEQ ID CC WTR of ADP96435 or to nucleobases 1757-1860 in the coding region of SEQ ID CC WTR of ADP96435 or to nucleobases 1757-1860 in the expression of dual specific phosphatase 6 and for treating a disease or condition associated CC with the expression of dual specific phosphatase 6 (e.g. a hyperproliferative disorder, developmental disorder, neural disorder or a apoptotic disorder. These may also be used as research reagents and CC diagnostice, to distinguish between functions of various members of a CC biological pathway, and in the treatment of a disease or disorder, which CC can be treated by modulating the expression of dual specific phosphatase CC is an antisense oligonucleotide targeting DUST6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                              The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitits B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. ```

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target section of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by

human

                                                                                                                         Recombinant cells transformed with DNA encoding a 5HT5a serotonin receptor express the receptor on their surfaces. They can be used in tests to identify ligands or modulators of the receptor and serotonin agonists and antagonists which may be useful in the treatment of 5HT5a associated disorders. Probes for the 5HT5a receptor (AAQ56313-18) can be used to detect expression of 5HT5a; to detect genetic abnormalities due to incorrect splicing, polymorphisms and point mutations; to diagnose neurological, cardiovascular or psychiatric disorders related to 5HT5a and to detect/isolate homologous nucleic acid sequences encoding 5HT5a polypeptides.                                                                                                                        AAQ71998-72000 and AAQ72003-9 are probes disclosed for use in the invention. The invention is for an improved method of detecting specific nucleic acids by a flow-through membrane nucleic acid hybridisation assay. This oligonucleotide is a capture probe and the base sequence corresponds to serovar L2 of Chlamydia trachomatis major outer membrane protein (MOMP) nucleotides position 747-766. The probe has a mixture of 4 long chain biotin moiety attached through amine functional groups (AMINO MODIFIER II, Clontech) at the 5'end. Pref. the membrane comprises nylon with streptavidin in a test site. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                        Flow-through membrane nucleic acid comprising nylon with streptavidin including biotin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              assay; major

                                                                                                                                                                                                                                                                                                                                                                                                                                               Nested PCR primers (AAT48848-51) were designed to obtain a full-length coding sequence for rat brain adenosine kinase (AK). These primers bind to the 5, and 3, untranslated regions of the gene. Rat brain cDNA was initially amplified with outer primers (AAT48848) AAT48850) and then with the inner primers (AAT48849, AAT48851). The PCR fragment was cloned into pGEM-T and inserts from multiple clones were sequenced. A full-length consensus sequence (AAT48843) coding for rat brain AK (AAM08369) was obtd

C generation of anti-human SC single chain Fv. An anti-human SC single chain Fv/protamine fusion protein containing a target binding moiety C capable of binding to a serpin enzyme complex receptor (SECR), and a containing a target binding moiety concluded to a mammalian cell. The method comprises conjugating the carrier to an expression vector encoding one or more c and coupling the carrier to an expression vector encoding one or more c gene products to form a pharmaceutical composition. A mammalian cell composition under conditions allowing binding to the receptor resulting c exogenous genetic material into target host cells exogenous genetic material into target host cells expressing SECR on their surface. The nucleic acid may encode a functional wild-type or mutant gene or may be an antisense sequence or other nucleic acid having therapeutic properties, e.g. enzymatic activity, cytckine activity which is delivered to a cell surface via the SECR binding molety. The nucleic acid can be compacted at high concentrations c condensation of such complexes provides structural features to the DNA/ c cationic lipid complex that provides structural features to the DNA/ cationic lipid complex that provides structural features to the DNA/ cationic lipid complex that provides structural features to the DNA/

The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-226825 represent human polymorphic sites described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele CC specific inhibitor (ASI) targeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal somatic CC cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the CC present in a population and tragets only one allelic form dethods can be CC used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cleasons, benign tumours, endometriosis, polycystic kidney disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

           The present invention describes Bacillus thuringiensis crystal proteins, which have insecticide activity and are mid-gut cell wall disruptors. The B. thuringiensis crystal proteins can be used in compositions as an insecticide. The polynucleotides encoding the crystal proteins as are used to detect a nucleic acid encoding a delta-endotoxin polypeptide and to transform plants such as corn, wheat, oat, rice, barley, turf grass,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence is a PCR primer for DNA encoding the rat brain adenosine kinase (AK) of the invention. Cells transformed with the DNA are used t produce recombinant AK. The AK is used: (i) to screen for specific agonists and antagonists; (ii) to raise antibodies; and (iii) therapeutically (reduced levels of AK are associated with resistance to nucleoside analogues with cytotoxic, anticancer and antiviral propertic with liver tumours, gout and acquired immune deficiency syndrome). Fragments of the DNA sequence are used as primers and probes to screen DNA libraries and for identifying AK-encoding nucleic acid, also as antisense therapeutics (particularly to increase local adenosine concentrations at the site of tissue injury, increasing the level of
                                                                                                                                                                           New Bacillus thuringiensis polypeptide for use as an insecticide protecting plants, such as, corn, wheat, oat, tobacco, or potato and in controlling insect populations, such as, Colorado potato between the controlling insect populations, such as, Colorado potato between the controlling insect populations, such as, Colorado potato between the controlling insect populations, such as, Colorado potato between the controlling insect populations, such as, Colorado potato between the controlling insect populations, such as, Colorado potato between the controlling insect populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacillus thuringiensis.

                                          The present invention relates to a method for detecting polymorphisms in a nucleic acid sequence. The method comprises amplifying nucleic acid sequences with a first primer homologous to a miniature inverted-repeat transposable element (MITE) in combination with another primer (non)homologous to MITE, separating the amplified nucleic acid fragments, and analysing the fragments obtained in relation to reference fragments obtained from the amplification of the nucleic acid with the primer homologous to MITE. The present sequence is a primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             berry, vegetable or tree to make it insect resistant. Insect populations, such as, Colorado potato beetle and southern rootworm can be controlled by expressing the crystal proteins in a plant. The crystal proteins can be used to kill or reduce the numbers of target insects in an area or applied to an area to prevent infestation by a susceptible insect. Antibodies to the crystal proteins are used to detect them in a sample. The crystal proteins are only distantly related to other delta-endotoxins toxic to dipteran or coleopteran insects and so provide for a new insecticide which insects have not become resistant to. The present sequence represents an oligonucleotide primer for the B. thuringiensis CryET75 protein, which is used in an example from the present invention
                                                                                                                                                                                                               Detecting polymorphisms of nucleic acid, useful for e.g. tracing progeny, by amplifying the nucleic acid with a homologous and a nonhomologous primer to a miniature inverted-repeat transposable element.
                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                                                         Bureau

                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for detecting polymorphisms in a nucleic acid sequence. The method comprises amplifying nucleic acid sequences with a first primer homologous to a miniature inverted-repeat transposable element (MITE) in combination with another primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 6; Page 19; 62pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-APR-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        miniature

12-SEP-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes
                31-MAY-2001
                                                                                                                                                                                    Single nucleotide polymorphism; SNP; human; cancer; heart disease; paternity testing; forensic science;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   10-SEP-1999; 99US-0153357P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               specification for equine arteritis virus (EAV) (Bucyrus strain) membrane protein (M). The antigenic peptide fragments (or peptide conjugates) are useful to diagnose infection of horses with EAV, the causative agent of equine viral arteritis, without reliance on clinical signs which may be variable and are undetectable in animals with subclinical infection. They can be used to detect antibodies to EAV, by incubating a sample with the fragment/conjugate as a specific binding agent (e.g. an immobilized binding agent or labeled secondary binding agent) and identifying any EAV antibodies present e.g. by enzyme-linked immunosorbent assay (ELISA). The present sequence is that of a PCR primer used in iPCR for EAVM truncated proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neonate screening; prenatal screening; gene chip; diagnosis; phenylketonuria; maple syrup disease; galactosemia; homocysteinuria; medium-chain acyl-CoA-dehydrogenase deficiency; biotinidase deficiency; familial hypercholesterolemia; familial defective apolipoprotein-B;
                                                                                                                                               DNA chip, useful for neonatal or prenatal screening for many genetic diseases simultaneously, carries oligonucleotides complementary to phenotypically relevant reference sequences.

DNA chip, useful for neonatal or prenatal screening diseases simultaneously, carries oligonucleotides cophenotypically relevant reference sequences.

ng for many genetic complementary to

```
two genetically determined phenotypes. (A) are used for simultaneous diagnosis of at least two of the following diseases: phenylketonuria (maple syrup disease), galactosemia, homocysteinuria, biotinidase deficiency, medium-chain acyl-CoA-dehydrogenase deficiency, familial hypercholesterolemia, familial defective apolipoprotein-B, cystic fibrosis, Marfan syndrome, Smith-Lemil-Opitz syndrome and androgenital syndrome. Specifically they are used in neonatal or prenatal diagnosis. (A) require a relatively small number of separate hybridization regions (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive, reliable and more sensitive than current physiological methods. AAH4886 AAH489166 represent oligonucleotides used to illustrate the method of t

Specifically they are used in neonatal or prenatal diagnosis.

(A) require a relatively small number of separate hybridization regions (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive, reliable and more sensitive than current physiological methods. AAH48868-AAH489166 represent oligonucleotides used to illustrate the method of the
                                                                          The present invention relates to human oligonucleotides comprising single nucleotide polymorphic site (SNF: AAH89797-AAH89219). The presequence is one such oligonucleotide. The oligonucleotides can be uforensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (GLAX )
                                                                                                                                                                                                                                                                                                          New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WO200134840-A2

                                                                                                             The present invention relates to human oligonuclectides comprising a single nuclectide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucles or the oligonucleotides can be used forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                 New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 21

The invention relates to an isolated nucleic acid from a human gene CC encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1), CC tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein CC 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme CC (ACE2) or procease inhibitor 4 (P14), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5, and 3, flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising CC obtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene CC encoding a protein selected from the group above; (3) constructing (M2) an individual at risk of developing a disorder CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor CC using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a fundividual comprises one or more polymorphic positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a comprise of the polymorphic positions within a gene encoding a construction of an ACE inhibitor positions within a gene encoding a comprise one or more polymorphic positions within a gene encoding a nucleate acid sample, determining the comprising obtaining a nucleate acid sample, determining the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cardiovascular disease; angina pectoris; hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; aneurysm; embolism; thrombosis; coronary artery disease; angioedaema; arteriosclerosis; atherosclerosis; hypersensitivity; sepsis; autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; fungal infection; COPD;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
CR and compositions are useful for detecting, diagnosing, treating,
CC preventing various disorders such as angioedaema and diseases which
CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
CR disease, trachomas, and cardiovascular diseases like angina pectoris,
CR hypertension, heart failure, myocardial infarction, ventricular
CR hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
CR artery disease, arteriosclerosis and/or atherosclerosis, and
CR hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
CR arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
CR obstructive pulmonary disease (COPD) and enterocolitis (many other
CR diseases and disorders are listed in the specification). The
CR polynucleotides are also useful for chromosome identification. Antibodies
CR against the proteins may be utilised for immunophenotyping of cell lines
CR and biological samples. The present sequence is included in the sequence
CR listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Local Similarity Matches 15; Conserv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) CC haplotypes using the genes comprising grouping at least two nucleic acids (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids (4) identifying (M3) an individual at risk of developing a disorder CC using the polymorphic data; (5) a library of nucleic acids, each of which CC comprises one or more polymorphic positions within a gene encoding a cC human protein selected from the group above; and (6) genotyping (M4) an CC individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, CC preventing various disorders such as angioedaema and diseases which CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, CC hypertrension, heart failure, myocardial infarction, ventricular CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary CC artery disease, arteriosclerosis and/or atherosclerosis, and constructive pulmonary disease, viral, bacterial or fungal infection, Chronic CC diseases, are listed in the specification. Antibodies are also useful for chromosome identification. Antibodies and biological samples. The present sequence is included in the sequence collist in the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
